

Reactive Energy Management

Low Voltage components

Catalogue
2011

Your requirements....

Optimize energy consumption

- By reducing electricity bills,
- By reducing power losses,
- By reducing CO₂ emissions.

Increase power availability

- Compensate for voltage sags detrimental to process operation,
- Avoid nuisance tripping and supply interruptions.

Improve your business performance

- Optimize installation size,
- Reduce harmonic distortion to avoid the premature ageing of equipment and destruction of sensitive components.

Our solutions....

Reactive energy management

In electrical networks, reactive energy results in increased line currents for a given active energy transmitted to loads.

The main consequences are:

- Need for oversizing of transmission and distribution networks by utilities,
- Increased voltage drops and sags along the distribution lines,
- Additional power losses.

This results in increased electricity bills for industrial customers because of:

- Penalties applied by most utilities on reactive energy,
- Increased overall kVA demand,
- Increased energy consumption within the installations.

Reactive energy management aims to optimize your electrical installation by reducing energy consumption, and to improve power availability. Total CO₂ emissions are also reduced.

Utility power bills are typically reduced by 5 % to 10 %.

"Our energy consumption was

reduced by **9 %**

after we installed 10 capacitor banks with detuned reactors. Electricity bill optimised by 8 % and payback in 2 years."

Testifies Michelin Automotive in France.

"Energy consumption reduced by

5 %

with LV capacitor bank and active filter installed."

POMA OTIS Railways, Switzerland.

"70 capacitor banks with detuned reactors installed, energy consumption reduced by 10 %, electricity bill optimised by 18 %, payback in just

1 year."

Madrid Barajas airport Spain.

Improve electrical networks and reduce energy costs

Power Factor Correction

Every electric machine needs active power (kW) and reactive power (kvar) to operate. The power rating of the installation in kVA is the combination of both:
 $(kVA)^2 = (kW)^2 + (kvar)^2$.

The Power Factor has been defined as the ratio of active power (kW) to apparent power (kVA).

Power Factor = $(kW) / (kVA)$.

The objective of Reactive Energy management is improvement of Power Factor, or "Power Factor Correction".

This is typically achieved by producing reactive energy close to the consuming loads, through connection of capacitor banks to the network.

Ensure reliability and safety on installations

Quality and reliability

- Continuity of service thanks to the high performance and long life expectancy of capacitors.
- 100% testing in manufacturing plant.
- Design and engineering with the highest international standards.

Safety

- Tested safety features integrated on each phase.
- Over-pressure system for safe disconnection at the end of life.
- All materials and components are free of PCB pollutants.

Efficiency and productivity

- Product development including innovation in ergonomics and ease of installation and connection.
- Specially designed components to save time on installation and maintenance.
- All components and solutions available through a network of distributors and partners in more than 100 countries.

Thanks to the know-how developed over 50 years, Schneider Electric ranks as the global specialist in Energy management providing a unique and comprehensive portfolio. Schneider Electric helps you to make the most of your energy with innovative, reliable and safe solutions.

Quality & Environment

Quality certified ISO 9001

A major strength

In each of its units, Schneider Electric has an operating organization whose main role is to verify quality and ensure compliance with standards. This procedure is:

- uniform for all departments;
- recognized by numerous customers and official organizations.

But, above all, its strict application has made it possible to obtain the recognition of independent organizations.

The quality system for design and manufacturing is certified in compliance with the requirements of the ISO 9001 Quality Assurance model.

Stringent, systematic controls

During its manufacture, each equipment item undergoes systematic routine tests to verify its quality and compliance:

- measurement of operating capacity and tolerances;
- measurement of losses;
- dielectric testing;
- checks on safety and locking systems;
- checks on low-voltage components;
- verification of compliance with drawings and diagrams.

The results obtained are recorded and initialled by the Quality Control Department on the specific test certificate for each device.

Schneider Electric undertakes to reduce the energy bill and CO₂ emissions of its customers by proposing products, solutions and services which fit in with all levels of the energy value chain. The Power Factor Correction and harmonic filtering offer form part of the energy efficiency approach.

A new solution for building your electrical installations

A comprehensive offer

Power Factor Correction and harmonic filtering form part of a comprehensive offer of products perfectly coordinated to meet all medium- and low-voltage power distribution needs.

All these products have been designed to operate together: electrical, mechanical and communications consistency.

The electrical installation is accordingly both optimized and more efficient:

- improved continuity of service;
- reduced power losses;
- guarantee of scalability;
- efficient monitoring and management.

You thus have all the trumps in hand in terms of expertise and creativity for optimized, reliable, expandable and compliant installations.

Tools for easier design and setup

With Schneider Electric, you have a complete range of tools that support you in the knowledge and setup of products, all this in compliance with the standards in force and standard engineering practice.

These tools, technical notebooks and guides, design aid software, training courses, etc. are regularly updated.

Schneider Electric joins forces with your expertise and your creativity for optimized, reliable, expandable and compliant installations.

Because each electrical installation is a specific case, there is no universal solution.

The variety of combinations available allows you to achieve genuine customization of technical solutions.

You can express your creativity and highlight your expertise in the design, development and operation of an electrical installation.

Principle of reactive energy management

In this representation, the Power Factor (P/S) is equal to $\cos\varphi$.

All AC electrical networks consume two types of power: active power (kW) and reactive power (kvar):

- **The active power P** (in kW) is the real power transmitted to loads such as motors, lamps, heaters, computers, etc. The electrical active power is transformed into mechanical power, heat or light.
- **The reactive power Q** (in kvar) is used only to power the magnetic circuits of machines, motors and transformers.

The apparent power S (in kVA) is the vector combination of active and reactive power.

The circulation of reactive power in the electrical network has major technical and economic consequences. For the same active power P, a higher reactive power means a higher apparent power, and thus a higher current must be supplied.

The circulation of active power over time results in active energy (in kWh). The circulation of reactive power over time results in reactive energy (kvarh).

In an electrical circuit, the reactive energy is supplied in addition to the active energy.

Reactive energy supplied and billed by the energy provider.

For these reasons, there is a great advantage in generating reactive energy at the load level in order to prevent the unnecessary circulation of current in the network. This is what is known as “**power factor correction**”. This is obtained by the connection of capacitors, which produce reactive energy in opposition to the energy absorbed by loads such as motors.

The result is a reduced apparent power, and an improved power factor P/S' as illustrated in the diagram opposite.

The power generation and transmission networks are partially relieved, reducing power losses and making additional transmission capacity available.

*The reactive power is supplied by capacitors.
No billing of reactive power by the energy supplier.*

Due to this higher supplied current, the circulation of reactive energy in distribution networks results in:

- > Overload of transformers
- > Higher temperature rise in power cables
- > Additional losses
- > Large voltage drops
- > Higher energy consumption and cost
- > Less distributed active power.

Why reactive energy management?

Benefits of reactive energy management

Optimized management of reactive energy brings economic and technical advantages.

Savings on the electricity bill

- > Eliminating penalties on reactive energy and decreasing kVA demand.
- > Reducing power losses generated in the transformers and conductors of the installation.

Example:

Loss reduction in a 630 kVA transformer $PW = 6,500\text{ W}$ with an initial Power Factor = 0.7.

With power factor correction, we obtain a final Power Factor = 0.98.

The losses become: 3,316 W, i.e. a reduction of 49 %.

Increasing available power

A high power factor optimizes an electrical installation by allowing better use of the components. The power available at the secondary of a MV/LV transformer can therefore be increased by fitting power factor correction equipment on the low voltage side.

The table opposite shows the increased available power at the transformer output through improvement of the Power Factor from 0.7 to 1.

Power factor	Increased available power
0.7	0 %
0.8	+ 14 %
0.85	+ 21 %
0.90	+ 28 %
0.95	+ 36 %
1	+ 43 %

Reducing installation size

Installing power factor correction equipment allows conductor cross-section to be reduced, since less current is absorbed by the compensated installation for the same active power.

The opposite table shows the multiplying factor for the conductor cross-section with different power factor values.

Power factor	Cable cross-section multiplying factor
1	1
0.80	1.25
0.60	1.67
0.40	2.50

Reducing voltage drops in the installation

Installing capacitors allows voltage drops to be reduced upstream of the point where the power factor correction device is connected. This prevents overloading of the network and reduces harmonics, so that you will not have to overrate your installation.

The selection of Power Factor Correction equipment can follow a 4-step process:

- **Calculation of the required reactive energy.**
- **Selection of the compensation mode:**
 - Central, for the complete installation
 - By sector
 - For individual loads, such as large motors.
- **Selection of the compensation type:**
 - Fixed, by connection of a fixed-value capacitor bank;
 - Automatic, by connection of a different number of steps, allowing adjustment of the reactive energy to the required value;
 - Dynamic, for compensation of highly fluctuating loads.
- **Allowance for operating conditions and harmonics.**

Step 1: Calculation of the required reactive power

The objective is to determine the required reactive power Q_c (kvar) to be installed, in order to improve the power factor $\cos \phi$ and reduce the apparent power S .

For $\phi' < \phi$, we obtain: $\cos \phi' > \cos \phi$ and $\tan \phi' < \tan \phi$.

This is illustrated in the diagram opposite.

Q_c can be determined from the formula $Q_c = P \cdot (\tan \phi - \tan \phi')$, which is deduced from the diagram.

Q_c = power of the capacitor bank in kvar.

P = active power of the load in kW.

$\tan \phi$ = tangent of phase shift angle before compensation.

$\tan \phi'$ = tangent of phase shift angle after compensation.

The parameters ϕ and $\tan \phi$ can be obtained from billing data, or from direct measurement in the installation.

The following table can be used for direct determination.

Before compensation		Reactive power (kvar) to be installed per kW of load, in order to get the required $\cos \phi'$ or $\tan \phi'$							
		$\tan \phi'$	0.75	0.62	0.48	0.41	0.33	0.23	0.00
		$\cos \phi'$	0.80	0.85	0.90	0.925	0.95	0.975	1.000
$\tan \phi$	$\cos \phi$								
1.73	0.5		0.98	1.11	1.25	1.32	1.40	1.50	1.73
1.02	0.70		0.27	0.40	0.54	0.61	0.69	0.79	1.02
0.96	0.72		0.21	0.34	0.48	0.55	0.64	0.74	0.96
0.91	0.74		0.16	0.29	0.42	0.50	0.58	0.68	0.91
0.86	0.76		0.11	0.24	0.37	0.44	0.53	0.63	0.86
0.80	0.78		0.05	0.18	0.32	0.39	0.47	0.57	0.80
0.75	0.80			0.13	0.27	0.34	0.42	0.52	0.75
0.70	0.82			0.08	0.21	0.29	0.37	0.47	0.70
0.65	0.84			0.03	0.16	0.24	0.32	0.42	0.65
0.59	0.86				0.11	0.18	0.26	0.37	0.59
0.54	0.88				0.06	0.13	0.21	0.31	0.54
0.48	0.90					0.07	0.16	0.26	0.48

Example: consider a 1000 kW motor with $\cos \phi = 0.8$ ($\tan \phi = 0.75$).

In order to obtain $\cos \phi = 0.95$, it is necessary to install a capacitor bank with a reactive power equal to $k \times P$, i.e.: $Q_c = 0.42 \times 1000 = 420$ kvar.

Method for determining compensation

Step 2: Selection of the compensation mode

The location of low-voltage capacitors in an installation constitutes the mode of compensation, which may be central (one location for the entire installation), by sector (section-by-section), at load level, or some combination of the latter two. In principle, the ideal compensation is applied at a point of consumption and at the level required at any moment in time.

In practice, technical and economic factors govern the choice.

The location for connection of capacitor banks in the electrical network is determined by:

- the overall objective (avoid penalties on reactive energy, relieve transformer or cables, avoid voltage drops and sags)
- the operating mode (stable or fluctuating loads)
- the foreseeable influence of capacitors on the network characteristics
- the installation cost.

Central compensation

The capacitor bank is connected at the head of the installation to be compensated in order to provide reactive energy for the whole installation. This configuration is convenient for a stable and continuous load factor.

Group compensation (by sector)

The capacitor bank is connected at the head of the feeders supplying one particular sector to be compensated. This configuration is convenient for a large installation, with workshops having different load factors.

Compensation of individual loads

The capacitor bank is connected right at the inductive load terminals (especially large motors). This configuration is very appropriate when the load power is significant compared to the subscribed power. This is the ideal technical configuration, as the reactive energy is produced exactly where it is needed, and adjusted to the demand.

Step 3: Selection of the compensation type

Different types of compensation should be adopted depending on the performance requirements and complexity of control:

- Fixed, by connection of a fixed-value capacitor bank
- Automatic, by connection of a different number of steps, allowing adjustment of the reactive energy to the required value
- Dynamic, for compensation of highly fluctuating loads.

Fixed compensation

This arrangement uses one or more capacitor(s) to provide a constant level of compensation. Control may be:

- Manual: by circuit-breaker or load-break switch
- Semi-automatic: by contactor
- Direct connection to an appliance and switched with it.

These capacitors are installed:

- At the terminals of inductive loads (mainly motors)
- At busbars supplying numerous small motors and inductive appliances for which individual compensation would be too costly
- In cases where the load factor is reasonably constant.

Automatic compensation

This kind of compensation provides automatic control and adapts the quantity of reactive power to the variations of the installation in order to maintain the targeted $\cos \varphi$. The equipment is installed at points in an installation where the active-power and/or reactive-power variations are relatively large, for example:

- on the busbars of a main distribution switchboard
- on the terminals of a heavily-loaded feeder cable.

Where the kvar rating of the capacitors is less than or equal to 15 % of the power supply transformer rating, a fixed value of compensation is appropriate. Above the 15 % level, it is advisable to install an automatically-controlled capacitor bank.

Control is usually provided by an electronic device (Power Factor Controller) which monitors the actual power factor and orders the connection or disconnection of capacitors in order to obtain the targeted power factor. The reactive energy is thus controlled by steps. In addition, the Power Factor Controller provides information on the network characteristics (voltage amplitude and distortion, power factor, actual active and reactive power ...) and equipment status. Alarm signals are transmitted in case of malfunction.

Connection is usually provided by contactors. For compensation of highly fluctuating loads, fast and highly repetitive connection of capacitors is necessary, and static switches must be used.

Dynamic compensation

This kind of compensation is required when fluctuating loads are present, and voltage fluctuations have to be prevented. The principle of dynamic compensation is to associate a fixed capacitor bank and an electronic var compensator, providing either leading or lagging reactive currents.

The result is continuously varying fast compensation, perfectly suitable for loads such as lifts, crushers, spot welding, etc.

Method for determining compensation

To know more about the influence of harmonics in electrical installations, see appendix page 80

Step 4: Allowing for operating conditions and harmonics

Capacitors should be selected depending on the working conditions expected during their lifetime.

Allowing for operating conditions

The operating conditions have a great influence on the life expectancy of capacitors. The following parameters should be taken into account:

- Ambient Temperature (°C)
- Expected over-current, related to voltage disturbances, including maximum sustained overvoltage
- Maximum number of switching operations/year
- Required life expectancy.

Allowing for harmonics

Depending on the magnitude of harmonics in the network, different configurations should be adopted.

- **Standard** capacitors: when no significant non-linear loads are present.
- **Oversized** capacitors: when a few non-linear loads are present. The rated current of capacitors must be increased in order to cope with the circulation of harmonic currents.
- **Harmonic** rated capacitors used **with detuned reactors**. Applicable when a significant number of non-linear loads are present. Reactors are necessary in order to limit the circulation of harmonic currents and avoid resonance.
- **Tuned filters**: when non-linear loads are predominant, requesting harmonic mitigation. A special design is generally necessary, based on on-site measurements and computer simulations of the network.

Capacitor selection

Different ranges with different levels of ruggedness are proposed:

- **"SDuty"**: Standard duty capacitors for standard operating conditions, and when no significant non-linear loads are present.
- **"HDuty"**: Heavy duty capacitors for difficult operating conditions, particularly voltage disturbances, or when a few non-linear loads are present. The rated current of capacitors must be increased in order to cope with the circulation of harmonic currents.
- **"Energy"**: Specially designed capacitors, for harsh operating conditions, particularly high temperature.
- **Capacitors with detuned reactors**: applicable when a significant number of non-linear loads are present.

Low Voltage capacitors with detuned reactors

Reactors should be associated with capacitor banks for Power Factor Correction in systems with significant non-linear loads, generating harmonics. Capacitors and reactors are configured in a series resonant circuit, tuned so that the series resonant frequency is below the lowest harmonic frequency present in the system.

For this reason, this configuration is usually called “Detuned Capacitor Bank”, and the reactors are referred to as “Detuned Reactors”.

The use of detuned reactors thus prevents harmonic resonance problems, avoids the risk of overloading the capacitors and helps reduce voltage harmonic distortion in the network.

The tuning frequency can be expressed by the relative impedance of the reactor (in %), or by the tuning order, or directly in Hz.

The most common values of relative impedance are 5.7, 7 and 14 % (14 % is used with high level of 3rd harmonic voltages).

Relative impedance (%)	Tuning order	Tuning frequency @50Hz (Hz)	Tuning frequency @60Hz (Hz)
5.7	4.2	210	250
7	3.8	190	230
14	2.7	135	160

The selection of the tuning frequency of the reactor capacitor depends on several factors:

- Presence of zero-sequence harmonics (3, 9, ...)
- Need for reduction of the harmonic distortion level
- Optimization of the capacitor and reactor components
- Frequency of ripple control system if any.
- To prevent disturbances of the remote control installation, the tuning frequency should be selected at a lower value than the ripple control frequency.
- In a detuned filter application, the voltage across the capacitors is higher than the system's rated voltage. In that case, capacitors should be designed to withstand higher voltages.
- Depending on the selected tuning frequency, part of the harmonic currents is absorbed by the detuned capacitor bank. In that case, capacitors should be designed to withstand higher currents, combining fundamental and harmonic currents.

Effective reactive energy

In the pages relating to detuned capacitor banks (Harmonic HDuty and Harmonic Energy), the reactive energy (kvar) given in the tables is the resulting reactive energy provided by the combination of capacitors and reactors.

Capacitor rated voltage

Capacitors have been specially designed to operate in detuned bank configurations. Parameters such as the rated voltage, over-voltage and over-current capabilities have been improved, compared to standard configuration.

Rated voltage and current

According to **IEC 60681-1** standard, the **rated voltage (U_N)** of a capacitor is defined as the continuously admissible operating voltage.

The **rated current (I_N)** of a capacitor is the current flowing through the capacitor when the rated voltage (U_N) is applied at its terminals, supposing a purely sinusoidal voltage and the exact value of reactive power (kvar) generated.

Capacitor units shall be suitable for continuous operation at an r.m.s. current of $(1.3 \times I_N)$.

In order to accept system voltage fluctuations, capacitors are designed to sustain over-voltages of limited duration. For compliance to the standard, capacitors are for example requested to sustain over-voltages equal to 1.1 times U_N , 8 h per 24 h.

VarplusCan and **VarplusBox** capacitors have been designed and tested extensively to operate safely on industrial networks. The design margin allows operation on networks including voltage fluctuations and common disturbances. Capacitors can be selected with their rated voltage corresponding to the network voltage. For different levels of expected disturbances, different technologies are proposed, with larger design margin for capacitors adapted to the most stringent working conditions (HDuty & Energy).

VarplusCan and **VarplusBox** capacitors when used along with Detuned Reactors have to be selected with a rated voltage higher than network service voltage (U_s). In detuned filter applications, the voltage across the capacitor is higher than the network service voltage (U_s).

The recommended rated voltage of capacitors to be used in detuned filter applications with respect to different network service voltage (U_s) and relative impedance is given in the table below.

These values ensure a safe operation in the most stringent operating conditions.

Less conservative values may be adopted, but a case by case analysis is necessary.

Capacitor Rated Voltage U_N (V)		Network Service Voltage U_s (V)				
		50 Hz		60 Hz		
Relative Impedance (%)	5.7	400	690	400	480	600
	7	480	830	480	575	690
	14	480		480		

Capacitors must be selected depending on the working conditions expected during their lifetime.

Solution	Description	Recommended use for	Max. condition
SDuty	Standard capacitor	> Networks with non significant non-linear loads	$N_{LL} \leq 10 \%$
		> Standard over-current	$1.5 I_N$
		> Standard operating temperature	55 °C (class D)
		> Normal switching frequency	5,000 /year
		> Standard life expectancy	Up to 100,000h*
HDuty	Heavy-duty capacitor	> A few non-linear loads	$N_{LL} \leq 20 \%$
		> Significant over-current	$1.8 I_N$
		> Standard operating temperature	55 °C (class D)
		> Significant switching frequency	7,000 /year
		> Long life expectancy	Up to 130,000h*
Energy	Capacitor for special conditions	> Significant number of non-linear loads (up to 25 %)	$N_{LL} \leq 25 \%$
		> Severe over-current	$2.5 I_N$
		> Extreme temperature conditions	70 °C
		> Very frequent switching	10,000 /year
		> Extra long life expectancy	Up to 160,000h*

* The maximum life expectancy is given considering standard operating conditions: rated voltage (U_N), rated current (I_N), 35 °C ambient temperature.
WARNING: the life expectancy will be reduced if capacitors are used in maximum working conditions.

Since the harmonics are caused by non-linear loads, an indicator for the magnitude of harmonics is the ratio of the total power of non-linear loads to the power supply transformer rating.

This ratio is denoted N_{LL} , and is also known as G_h/S_n :

N_{LL} = Total power of non-linear loads (G_h) / Installed transformer rating (S_n).

Example:

- Power supply transformer rating: $S_n = 630 \text{ kVA}$
- Total power of non-linear loads: $G_h = 150 \text{ kVA}$
- $N_{LL} = (150/630) \times 100 = 24 \%$

It is recommended to use Detuned Reactors with Harmonic Rated Capacitors (higher rated voltage than the network service voltage - see the Harmonic Application Tables) for $N_{LL} > 25 \%$ and up to 50 %.
See page 73 for Voltage selection of capacitors with Detuned Reactors.

Note: there is a high risk in selecting the capacitors based only on N_{LL} as the harmonics in grid may cause current amplification and capacitors along with other devices may fail. Refer to page 80 for further details.

Safety	Self-healing + pressure-sensitive disconnecter + discharge device (50 V/1 min)		
Dielectric	Metallized polypropylene film with Zn/Al alloy	Metallized Polypropylene film with Zn/Al alloy with special profile metallization and wave cut	Double metallized paper + Polypropylene film
Impregnation	Non-PCB, Biodegradable resin	Non-PCB, sticky (dry) Biodegradable resin	Non-PCB, oil
Ambient temperature	min. -25 °C max 55 °C		min. -25 °C max 70 °C
Protection	IP20, Indoor		
Mounting	Upright	Upright, Horizontal	Upright
Terminals	Bushing terminals designed for large cable termination and direct busbar mounting for banking		

Aluminum can capacitors specially designed and engineered to deliver a long working life with low losses in standard, heavy-duty and severe operating conditions. Suitable for Fixed and Automatic PFC, real time compensation, detuned and tuned filters.

VarplusCan.

Main features

Easy installation & maintenance

- Optimized design for low weight, compactness and reliability to ensure easy installation.
- Unique termination system that allows maintained tightness.
- 1 point for mounting and earthing.
- Vertical and horizontal position.

Safety

- Self-healing.
- Pressure-sensitive disconnecter on all three phases.
- Discharge resistors fitted.
- Finger-proof CLAMPTITE terminals to reduce risk of accidental contact and to ensure firm termination (10 to 30 kvar).
- Special film resistivity and metallization profile for higher thermal efficiency, lower temperature rise and enhanced life expectancy.

Compacity

- Optimized geometric design (small dimensions and low weight).
- Available on request in single phase.

For professionnals

- High life expectancy up to 160,000 hours.
- Very high overload capabilities and good thermal and mechanical properties.
- Economic benefits due to its compact size.
- Easy maintenance.
- Unique finger proof termination to ensure tightness.

VarplusCan

Protection	IP20 Indoor		
Mounting	Upright	Upright, horizontal	Upright
Terminals	- Double fast-on + cable (≤ 10 kvar) - CLAMPTITE - Three-phase terminal with electric shock protection (finger-proof) - Stud terminal (> 30 kvar)		

A safe, reliable and high-performance solution for power factor correction in standard operating conditions.

VarplusCan SDuty

Operating conditions

- For networks with insignificant non-linear loads: ($N_{LL} \leq 10\%$).
- Standard voltage disturbances.
- Standard operating temperature up to 55 °C.
- Normal switching frequency up to 5000 /year.
- Maximum current (including harmonics) is $1.5 \times I_N$.

Technology

Constructed internally with three single-phase capacitor elements assembled in an optimized design. Each capacitor element is manufactured with metallized polypropylene film as the dielectric having features such as heavy edge metallization and special profiles which enhance the "self-healing" properties.

The active capacitor elements are encapsulated in a specially formulated biodegradable, non-PCB, PUR (soft) resin which ensures thermal stability and heat removal from inside the capacitor.

The unique finger-proof CLAMPTITE termination is fully integrated with discharge resistors and allows suitable access to tightening and ensures cable termination without any loose connections.

Once tightened, the design guarantees that the tightening torque is always maintained.

For lower ratings, double fast-on terminals with wires are provided.

Benefits

- Safety:
 - self-healing
 - pressure-sensitive disconnecter on all three phases
 - discharge resistor.
- Life expectancy up to 100,000 hours.
- Economic benefits and easy installation due to its compact size and low weight.
- Easy maintenance thanks to its unique finger-proof termination to ensure tightening.
- Also available in small power ratings from 1 to 5 kvar.

A safe, reliable and high-performance solution for power factor correction in heavy-duty operating conditions.

PE90131 eps

PE90130 eps

VarplusCan HDuty

Operating conditions

- For networks with insignificant non-linear loads: ($N_{LL} < 20\%$).
- Significant voltage disturbances.
- Standard operating temperature up to $55\text{ }^{\circ}\text{C}$.
- Normal switching frequency up to 7 000 /year.
- Maximum current (including harmonics) is $1.8 \times I_N$.

Technology

Constructed internally with three single-phase capacitor elements. Each capacitor element is manufactured with metallized polypropylene film as the dielectric, having features such as heavy edge, slope metallization and wave-cut profile to ensure increased current handling capacity and reduced temperature rise.

The active capacitor elements are coated with specially formulated sticky resin which ensures high overload capabilities and good thermal and mechanical properties

The unique finger-proof CLAMPTITE termination is fully integrated with discharge resistors, allowing suitable access for tightening and ensuring cable termination without any loose connections.

For lower ratings, double fast-on terminals with wires are provided.

Benefits

- Total safety:
 - self-healing
 - pressure-sensitive disconnecter
 - discharge resistor.
- Long life expectancy (up to 130,000 hours).
- Installation in any position.
- Optimized geometric design for improved thermal performance.
- Special resistivity and metallisation profile will enhance life and will give higher thermal efficiency with lower temperature rise.
- Unique finger-proof termination that ensures tightening for CLAMPITE terminals.

VarplusCan Energy

A safe, reliable and high-performance solution for power factor correction for severe operating conditions.

PE60131 eps

VarplusCan Energy

Operating conditions

- For networks with significant non-linear loads: ($N_{LL} < 25\%$).
- Severe voltage disturbances.
- Highest operating temperature (up to $70\text{ }^{\circ}\text{C}$).
- High switching frequency up to 10,000 /year.
- Maximum current withstand $2.5 \times I_N$.

Technology

Constructed internally with three single-phase capacitor elements. This is the only technology which is capable of giving the longest life, highest overload limits and the highest operating ambient temperature due to use of the combination of polypropylene film and metallized paper.

The presence of the paper ensures high-quality impregnation which is critical for increasing dielectric strength.

Further, this quality of oil-impregnated dielectric system has far superior capabilities in terms of partial discharge behaviour and heat conduction.

Benefits

- Safety:
 - self-healing
 - pressure-sensitive disconnecter
 - discharge resistor.
- Extra long life expectancy (up to 160,000 hours).
- Very high overload capabilities and good thermal and mechanical properties.
- Overcurrent withstand capabilities up to $2.5 \times I_N$.
- Highest operating temperature (up to $70\text{ }^{\circ}\text{C}$).

Technical specifications

General characteristics

Standards		IEC 60831-1/-2
Voltage range		380 to 525 V
Frequency		50 / 60 Hz
Power range		5 to 15 kvar
Losses (dielectric)		< 0.2 W/kvar
Losses (total)		< 0.5 W/kvar
Capacitance tolerance		-5%, +10%
Voltage test	Between terminals	2.15 x U _N (AC), 10 s
	Between terminal & container	3 kV (AC), 10 s or 3.66 kV (AC), 2 s
	Impulse voltage	8 kV
Discharge resistor		Fitted, standard discharge time 60 s Discharge time 180 s on request

Working conditions

Ambient temperature	-25 / 70 °C
Humidity	95 %
Altitude	2,000 m above sea level
Overvoltage	1.1 x U_N 8 h in every 24 h
Overcurrent	Up to 2.5 x I_N
Peak inrush current	350 x I_N
Switching operations (max.)	Up to 10,000 switching operations per year
Mean Life expectancy	Up to 160,000 hrs
Harmonic content	$N_{LL} \leq 25$ %

Installation characteristics

Mounting position	Indoor, upright
Fastening	Threaded M12 stud at the bottom
Earthing	
Terminals	CLAMPTITE - three-way terminal with electric shock protection (finger-proof) & double fast-on terminal in lower kvar

Safety features

Safety	Self-healing + Pressure-sensitive disconnecter + Discharge device
Protection	IP20

Construction

Casing	Extruded Aluminium Can
Dielectric	Double metallized paper + Polypropylene film
Impregnation	Non-PCB, oil

This harmonic rated range of capacitors is dedicated to applications where a high number of non-linear loads are present (N_{LL} up to 30 %). These capacitors are designed for use with detuned reactors, based on the Standard Duty technology.

Detuned reactor

VarplusCan SDuty

Operating conditions

- For networks with a large number of non-linear loads ($N_{LL} < 50 \%$).
- Significant voltage disturbances.
- Significant switching frequency up to 5000 /year.

Rated voltage

In a detuned filter application, the voltage across the capacitors is higher than the network service voltage (U_s). Then, capacitors must be designed to withstand higher voltages.

Depending on the selected tuning frequency, part of the harmonic currents are absorbed by the detuned capacitor bank. Then, capacitors must be designed to withstand higher currents, combining fundamental and harmonic currents.

The rated voltage of VarplusCan SDuty capacitors is given in the table below, for different values of network service voltage and relative impedance.

Capacitor Rated Voltage U_N (V)		Network Service Voltage U_s (V)	
		50 Hz	60 Hz
		400	400
Relative Impedance (%)	5.7	480	480
	7		
	14		

In the following pages, the effective power (kvar) given in the tables is the reactive power provided by the combination of capacitors and reactors.

VarplusCan SDuty + Detuned Reactor + Contactor

VarplusCan HDuty harmonic applications

This harmonic rated range of capacitors is dedicated to applications where a high number of non-linear loads are present (N_{LL} up to 30 %). These capacitors are designed for use with detuned reactors, based on the Standard Heavy technology.

Detuned reactor

VarplusCan HDuty

Operating conditions

- For networks with a large number of non-linear loads ($N_{LL} < 50 \%$).
- Significant voltage disturbances.
- Significant switching frequency up to 7 000 /year.

Rated voltage

In a detuned filter application, the voltage across the capacitors is higher than the network service voltage (U_s). Then, capacitors must be designed to withstand higher voltages.

Depending on the selected tuning frequency, part of the harmonic currents are absorbed by the detuned capacitor bank. Then, capacitors must be designed to withstand higher currents, combining fundamental and harmonic currents.

The rated voltage of VarplusCan HDuty capacitors is given in the table below, for different values of network service voltage and relative impedance.

Capacitor Rated Voltage U_N (V)		Network Service Voltage U_s (V)				
		50 Hz		60 Hz		
		400	690	400	480	600
Relative Impedance (%)	5.7	480	830	480	575	690
	7					
	14					

In the following pages, the effective power (kvar) given in the tables is the reactive power provided by the combination of capacitors and reactors.

VarplusCan HDuty + Detuned Reactor + Contactor

This harmonic rated range of capacitors is dedicated to applications where a high number of non-linear loads are present (N_{LL} up to 30 %). These capacitors are designed for use with detuned reactors, based on the Energy technology.

Detuned reactor

VarplusCan SDuty

Operating conditions

- For networks with a large number of non-linear loads ($N_{LL} < 50 \%$).
- Significant voltage disturbances.
- Severe temperature conditions up to 70 °C.
- Very frequent switching operations up to 10,000/year.

Rated voltage

In a detuned filter application, the voltage across the capacitors is higher than the network service voltage (U_s). Then, capacitors must be designed to withstand higher voltages.

Depending on the selected tuning frequency, part of the harmonic currents is absorbed by the detuned capacitor bank. Then, capacitors must be designed to withstand higher currents, combining fundamental and harmonic currents.

The rated voltage of VarplusCan Energy capacitors is given in the table below, for different values of network service voltage and relative impedance.

Capacitor Rated Voltage U_N (V)		Network Service Voltage U_s (V)	
		50 Hz	60 Hz
		400	400
Relative Impedance (%)	5.7	480	480
	7		
	14		

In the following pages, the effective power (kvar) given in the tables is the reactive power provided by the combination of capacitors and reactors.

VarplusCan Energy + Detuned Reactor + Contactor

VarplusBox capacitors deliver reliable performance in the most severe application conditions, in Fixed & Automatic PFC systems, in networks with frequently switched loads and harmonic disturbances.

VarplusBox.

Main features

Robustness

- Double metallic protection.
- Mechanically well suited for “stand-alone” installations.

Safety

- Its unique safety feature electrically disconnects the capacitors safely at the end of their useful life.
- The disconnectors are installed on each phase, which makes the capacitors very safe, in addition to the protective steel enclosure.

Flexibility

- These capacitors can be easily mounted inside panels or in a stand-alone configuration.
- Suitable for flexible bank configuration.

For professionnals

- Metal box enclosure.
- High power ratings up to 100 kvar.
- Easy repair and maintenance.
- Up to 70 °C temperature.
- High inrush current withstand up to $400 \times I_N$.
- Stand-alone PFC equipment.
- Direct connection to a machine, in harsh environmental conditions.

VarplusBox capacitor

	SDuty	HDuty	Energy
Construction	Steel sheet enclosure		
Voltage range	380 V - 480 V	230 V - 830 V	400 V - 525 V
Power range (three-phase)	2.5 - 100 kvar		
Peak inrush current	Up to $200 \times I_N$	Up to $250 \times I_N$	Up to $350 \times I_N$
Overvoltage	$1.1 \times U_N$ 8 h every 24 h		
Overcurrent	$1.5 \times I_N$	$1.8 \times I_N$	$2.5 \times I_N$
Mean life expectancy	Up to 100,000 h	Up to 130,000 h	Up to 160,000 h
Safety	Self-healing + pressure-sensitive disconnecter + discharge device (50 V/1 min)		
Dielectric	Metallized polypropylene film with Zn/Al alloy	Metallized Polypropylene film with Zn/Al alloy with special profile metallization and wave cut	Double metallized paper + Polypropylene film
Impregnation	Non-PCB, Biodegradable resin	Non-PCB, sticky (dry) Biodegradable resin	Non-PCB, oil
Ambient temperature	min. -25 °C max 55 °C		min. -25 °C max 70 °C
Protection	IP20 Indoor		
Mounting	Upright	Upright, Horizontal	Upright
Terminals	Bushing terminals designed for large cable termination and direct busbar mounting for banking		

A safe, reliable and high-performance solution for power factor correction in standard operating conditions.

VarplusBox SDuty

Operating conditions

- For networks with insignificant non-linear loads ($N_{LL} \leq 10 \%$).
- Standard voltage disturbances.
- Standard operating temperature up to 55 °C.
- Normal switching frequency up to 5000 /year.
- Maximum current withstand $1.5 \times I_N$.

Technology

Constructed internally with three single-/three-phase capacitor elements.

The design is specially adapted for mechanical stability. The enclosures of the units are designed to ensure that the capacitors operate reliably in hot and humid tropical conditions, without the need of any additional ventilation louvres (see technical specifications).

Special attention is paid to equalization of temperatures within the capacitor enclosures since this gives better overall performance.

Benefits

- Mechanically well suited for “stand-alone” installations.
- Safety:
 - self-healing
 - pressure-sensitive disconnecter on all three phases
 - discharge resistor.
- These capacitors can be easily mounted inside panels or in a stand-alone configuration.
- Availability on power ratings up to 100 kvar.
- Suitable for flexible banking.

VarplusBox SDuty

Technical specifications

General characteristics

Standards		IEC 60831-1/-2
Voltage range		380 to 480 V
Frequency		50 / 60 Hz
Power range		7.5 to 100 kvar
Losses (dielectric)		< 0.2 W/kvar
Losses (total)		< 0.5 W/kvar
Capacitance tolerance		-5%, +10 %
Voltage test	Between terminals	2.15 x U _N (AC), 10 s
	Between terminal & container	3 kV (AC), 10 s or 3.66 kV (AC), 2 s
	Impulse voltage	8 kV
Discharge resistor		Fitted, standard discharge time 60 s Discharge time 180 s on request

Working conditions

Ambient temperature	-25 / 55 °C (Class D)
Humidity	95 %
Altitude	2,000 m above sea level
Overvoltage	1.1 x U_N 8 h in every 24 h
Overcurrent	Up to 1.5 x I_N
Peak inrush current	200 x I_N
Switching operations (max.)	Up to 5,000 switching operations per year
Mean Life expectancy	Up to 100,000 hrs
Harmonic content	$N_{LL} \leq 10$ %

Installation characteristics

Mounting position	Indoor, upright
Fastening	Mounting cleats
Earthing	
Terminals	Bushing terminals designed for large cable termination and direct busbar mounting for banking

Safety features

Safety	Self-healing + Pressure-sensitive disconnecter for each phase + Discharge device
Protection	IP20

Construction

Casing	Sheet steel enclosure
Dielectric	Metallized polypropylene film with Zn/Al alloy.
Impregnation	Biodegradable, Non-PCB, PUR (soft) resin

VarplusBox HDuty

A safe, reliable and high-performance solution for power factor correction in standard operating conditions.

VarplusBox HDuty "Compact"

Operating conditions

- For networks with significant non-linear loads ($N_{LL} \leq 20\%$).
- Standard voltage disturbances.
- Standard operating temperature up to 55 °C.
- Significant number of switching operations up to 7,000/year.
- Long life expectancy up to 130,000 hours.

Technology

Constructed internally with three single-phase capacitor elements.

The design is specially adapted for mechanical stability. The enclosures of the units are designed to ensure that the capacitors operate reliably in hot and humid tropical conditions, without the need of any additional ventilation louvres (see technical specifications).

Special attention is paid to equalization of temperatures within the capacitor enclosures since this gives better overall performance.

Special design for total modularity and easy assembly with VarplusBox HDuty "Compact".

Benefits

- High performance:
 - heavy edge metallization/wave-cut edge to ensure high inrush current capabilities
 - special resistivity and profile metallization for better self-healing & enhanced life.
- Safety:
 - its unique safety feature electrically disconnects the capacitors safely at the end of their useful life
 - the disconnectors are installed on each phase, which makes the capacitors very safe, in addition to its protective steel enclosure.
- Flexibility:
 - special "Compact" case with small footprint to be easily mounted and assembled
 - availability on power ratings up to 100 kvar with parallel connection.

VarplusBox

Accessory for VarplusBox HDuty Compact

One set of 3-phase copper bars and assembly of 2 and 3 capacitors: ref. 51459.

Technical specifications

General characteristics

Standards	IEC 60831-1/-2
Voltage range	230 to 830 V
Frequency	50 / 60 Hz
Power range	2.5 to 100 kvar (from 2.5 to 20 kvar: unique footprint for easy assembly)
Losses (dielectric)	< 0.2 W/kvar
Losses (total)	< 0.5 W/kvar
Capacitance tolerance	-5 %, +10 %
Voltage test	Between terminals 2.15 x U _N (AC), 10 s
	Between terminal & container ≤ 525 V: 3 kV (AC), 10 s or 3.66 kV (AC), 2 s > 525 V: 3.66 kV (AC), 10 s or 4.4 kV (AC), 2 s
	Impulse voltage ≤ 690 V: 8 kV > 690 V: 12 kV
Discharge resistor	Fitted, standard discharge time 60 s Discharge time 180 s on request

Working conditions

Ambient temperature	-25 / 55 °C (Class D)
Humidity	95 %
Altitude	2,000 m above sea level
Overvoltage	1.1 x U _N 8h in every 24 h
Overcurrent	Up to 1.8 x I _N
Peak inrush current	250 x I _N
Switching operations (max.)	Up to 7,000 switching operations per year
Mean Life expectancy	Up to 130,000 hrs
Harmonic content	N _{LL} ≤ 20 %

Installation characteristics

Mounting position	Indoor, upright & horizontal
Fastening	Mounting cleats
Earthing	
Terminals	Bushing terminals designed for large cable termination and direct busbar mounting for banking

Safety features

Safety	Self-healing + Pressure-sensitive disconnecter for each phase + Discharge device
Protection	IP20 (IP54 for VarplusBox Compact)

Construction

Casing	Sheet steel enclosure
Dielectric	Metallized polypropylene film with Zn/Al alloy. special resistivity & profile. Special edge (wave-cut)
Impregnation	Non-PCB, PUR sticky resin (Dry)

VarplusBox Compact

VarplusBox Energy

A safe, reliable and high-performance solution for power factor correction in standard operating conditions.

Operating conditions

- For networks with significant non-linear loads: ($N_{LL} < 25\%$).
- Severe voltage disturbances.
- Highest operating temperature (up to 70 °C).
- High switching frequency, up to 10,000/year
- Maximum current withstand $2.5 \times I_N$.

Technology

Constructed internally with three single-phase capacitor elements.

The design is specially adapted for mechanical stability. The enclosures of the units are designed to ensure that the capacitors operate reliably in hot and humid tropical conditions, without the need of any additional ventilation louvres (see technical specifications).

Energy capacitors are the only technology which is capable of giving the longest life, highest overload limits and the highest operating ambient temperature due to use of the combination of polypropylene film and metallized paper.

Benefits

- High performance:
 - high life expectancy up to 160,000 hours
 - very high overload capabilities and good thermal and mechanical properties
 - highest operating temperature (up to 70 °C).
- Safety:
 - its unique safety feature electrically disconnects the capacitors safely at the end of their useful life;
 - the disconnectors are installed on each phase, which makes the capacitors very safe, in addition to its protective steel enclosure.

VarplusBox Energy

Technical specifications

General characteristics

Standards		IEC 60831-1/-2
Voltage range		380 to 525 V
Frequency		50 / 60 Hz
Power range		5 to 100 kvar
Losses (dielectric)		< 0.2 W / kvar
Losses (total)		< 0.5 W / kvar
Capacitance tolerance		-5 %, +10 %
Voltage test	Between terminals	2.15 x U _N (AC), 10 s
	Between terminal & container	3 kV (AC), 10 s or 3.66 kV (AC), 2 s
	Impulse voltage	8 kV
Discharge resistor		Fitted, standard discharge time 60 s Discharge time 180 s on request

Working conditions

Ambient temperature	-25 / 70 °C (Class D)
Humidity	95 %
Altitude	2,000 m above sea level
Overvoltage	1.1 x U_N 8 h in every 24 h
Overcurrent	Up to 2.5 x I_N
Peak inrush current	350 x I_N
Switching operations (max.)	Up to 10,000 switching operations per year
Mean Life expectancy	Up to 160,000 hrs
Harmonic content	$N_{LL} \leq 25$ %

Installation characteristics

Mounting position	Indoor, upright & horizontal
Fastening	Mounting cleats
Earthing	
Terminals	Bushing terminals designed for large cable termination and direct busbar mounting for banking

Safety features

Safety	Self-healing + Pressure-sensitive disconnecter for each phase + Discharge device
Protection	IP20

Construction

Casing	Sheet steel enclosure
Dielectric	Double metallized paper + polypropylene film
Impregnation	Non-PCB, oil

This harmonic rated range of capacitors is dedicated to applications where a high number of non-linear loads are present (N_{LL} up to 30 %). These capacitors are designed for use with detuned reactors, based on the Heavy Duty technology.

Detuned reactor VarplusBox HDuty

Operating conditions

- For networks with a large number of non-linear loads ($N_{LL} < 50 \%$).
- Significant voltage disturbances.
- Very frequent switching operations, up to 7,000/year.

Rated voltage

In a detuned filter application, the voltage across the capacitors is higher than the network service voltage (U_s). Then, capacitors must be designed to withstand higher voltages.

Depending on the selected tuning frequency, part of the harmonic currents is absorbed by the detuned capacitor bank. Then, capacitors must be designed to withstand higher currents, combining fundamental and harmonic currents.

The rated voltage of VarplusBox HDuty capacitors is given in the table below, for different values of network service voltage and relative impedance.

Capacitor Rated Voltage U_N (V)		Network Service Voltage U_s (V)				
		50 Hz		60 Hz		
		400	690	400	480	600
Relative Impedance (%)	5.7	480	830	480	575	690
	7					
	14					

In the following pages, the effective power (kvar) given in the tables is the reactive power provided by the combination of capacitors and reactors.

VarplusBox Energy Harmonic applications

This harmonic rated range of capacitors is dedicated to applications where a high number of non-linear loads are present (N_{LL} up to 30 %). These capacitors are designed for use with detuned reactors, based on the Energy technology.

Detuned reactor VarplusBox Energy

Operating conditions

- For networks with a large number of non-linear loads ($N_{LL} < 50 \%$).
- Significant voltage disturbances.
- Severe temperature conditions up to 70 °C.
- Very frequent switching operations up to 10,000/year.

Rated voltage

In a detuned filter application, the voltage across the capacitors is higher than the network service voltage (U_s). Then, capacitors must be designed to withstand higher voltages.

Depending on the selected tuning frequency, part of the harmonic currents is absorbed by the detuned capacitor bank. Then, capacitors must be designed to withstand higher currents, combining fundamental and harmonic currents.

The rated voltage of VarplusBox Energy capacitors is given in the table below, for different values of network service voltage and relative impedance.

Capacitor Rated Voltage U_N (V)		Network Service Voltage U_s (V)	
		50 Hz	60 Hz
		400	400
Relative Impedance (%)	5.7	480	480
	7		
	14		

In the following pages, the effective power (kvar) given in the tables is the reactive power provided by the combination of capacitors and reactors.

<i>Low Voltage capacitors</i>	
Detuned reactors	68
<i>Power Factor controllers</i>	71
<i>Contactors</i>	75
<i>Appendix</i>	79

The detuned reactors (DR) are designed to protect the capacitors by preventing amplification of the harmonics present on the network.

PE90154-eps

Operating conditions

- Use: indoor.
- Storage temperature: -40 °C, +60 °C.
- Relative humidity in operation: 20-80 % .
- Salt spray withstand: 250 hours (for 400 V - 50 Hz range).
- Operating temperature:
 - altitude: ≤ 1000 m: Min = 0 °C, Max = 55 °C, highest average over 1 year = 40 °C, 24 hours = 50 °C.
 - altitude: ≤ 2000 m: Min = 0 °C, Max = 50°C, highest average over 1 year = 35 °C, 24 hours = 45°C.

Installation guidelines

- Forced ventilation required.
- Vertical detuned reactor winding for better heat dissipation.

As the detuned reactor is provided with thermal protection, the normally closed dry contact must be used to disconnect the step in the event of overheating.

Technical specifications

General characteristics	
Description	Three-phase, dry, magnetic circuit, impregnated
Degree of protection	IP00
Insulation class	H
Rated voltage	400 to 690 V - 50 Hz 400 to 600 V - 60 Hz Other voltages on request
Inductance tolerance per phase	-5, +5 %
Insulation level	1.1 kV
Dielectric test 50/60 Hz between windings and windings/earth	4 kV, 1 min
Thermal protection	Restored on terminal block 250 V AC, 2 A

Let's define the service current (I_s) as the current absorbed by the capacitor and detuned reactor assembly, when a purely sinusoidal voltage is applied, equal to the network service voltage (V).

$$I_s = Q \text{ (kvar)} / (\sqrt{3} \times U_s)$$

In order to operate safely in real conditions, a detuned reactor must be designed to accept a maximum permanent current (I_{MP}) taking account of harmonic currents and voltage fluctuations.

The following table gives the typical percentage of harmonic currents considered for the different tuning orders.

(%)	Harmonic currents			
Tuning order	i_3	i_5	i_7	i_{11}
2.7	5	15	5	2
3.8	3	40	12	5
4.2	2	63	17	5

A 1.1 factor is applied in order to allow long-term operation at a supply voltage up to $(1.1 \times U_s)$. The resulting maximum permanent current (I_{MP}) is given in the following table:

Tuning order	I_{MP} (times I_s)
2.7	1.12
3.8	1.2
4.2	1.3

Varlogic NR6/12

Varlogic NRC12

Performance

- Permanent monitoring of the network and equipment.
- Information provided about equipment status.
- Alarm signals transmitted in case of anomaly (for NR6, NR12, NRC12).
- Communication by Modbus protocol (for NRC12).
- New control algorithm designed to reduce the number of switching operations and quickly attain the targeted power factor.

Simplicity

- Simplified programming and possibility of intelligent self set-up.
- Ergonomic layout of control buttons.
- Quick and simple mounting and wiring.
- A special menu allows controller self-configuration.

User-friendliness

The large display allows:

- Direct viewing of installation electrical information and capacitor stage condition.
- Direct reading of set-up configuration.
- Intuitive browsing in the various menus (indication, commissioning, configuration).
- Alarm indication.

Monitoring and protection

Alarms

- Should an anomaly occur on the network or the capacitor bank, alarms are indicated on the screen and alarm contact closure is initiated.
- The alarm message is maintained on the screen once the fault clears until it is manually removed.

Protection

- If necessary, the capacitor steps are automatically disconnected to protect the equipment.

Range

Special contactors LC1 D•K are designed for switching 3-phase, single- or multiple-step capacitor banks. They comply with standards IEC 60070 and 60831, NFC 54-100, VDE 0560, UL and CSA.

PE00157.jpg

Contactor LC1DFK

PE00158.jpg

Contactor LC1DPK

Operating conditions

There is no need to use choke inductors for either single or multiple-step capacitor banks.
 Short-circuit protection must be provided by gl type fuses rated at 1.7...2 In.

Specifications

These contactors are fitted with a block of early make poles and damping resistors, limiting the value of the current on closing to 60 IS max.
 This current limiting increases the life of all the installation's components, especially the fuses and capacitors.

Technical specifications

	Network voltage (V) 50-60Hz			Part number
	220 - 240	400 - 440	660 - 690	
kvar	6.7	12.5	18	LC1 DFK----
	8.5	16.7	24	LC1 DGK----
	10	20	30	LC1 DLK----
	15	25	36	LC1 DMK----
	20	33.3	48	LC1 DPK----
	25	40	58	LC1 DTK----
	40	60	92	LC1 DWK----

Standard control circuit voltages (@ 50/60 Hz) are:
 24, 42, 48, 110, 115, 220, 230, 240, 380, 400, 415, 440 V.
 Other voltages are available on request.

The power values given in the selection table are for the following operating conditions:

Prospective peak current at switch-on	LC1 D•K	200 In
Maximum operating rate	LC1 DFK, DGK, DLK, DMK, DPK	240 operating cycles/hour
	LC1 DTK, DWK	100 operating cycles/hour
Electrical durability at nominal load	All contactor ratings	400 V 300,000 operating cycles
		690 V 200,000 operating cycles

Contactors

LC1, DFK, DGK

LC1	C	Type of fixing
DFK	117	LC1 D12
DGK	122	LC1 D18

LC1, DPK, DTK

LC1	Type of fixing
DPK	LC1 D40
DTK	LC1 D50

LC1, DLK, DMK

LC1	C	Type of fixing
DLK	117	LC1 D40
DMK	122	LC1 D50

LC1, DWK

LC1	Type of fixing
DWK	LC1 D80

Influence of harmonics in electrical installations	80

Influence of harmonics in electrical installations

Since the harmonics are caused by non-linear loads, an indicator for the magnitude of harmonics is the ratio of the total power of non-linear loads to the power supply transformer rating.

This ratio is denoted N_{LL} , and is also known as G_n/S_n :

N_{LL} = Total power of non-linear loads (G_n) / Installed transformer rating (S_n)

Example:

> Power supply transformer rating: $S_n = 630$ kVA

> Total power of non-linear loads: $G_n = 150$ kVA

> $N_{LL} = (150/630) \times 100 = 24\%$.

Definition of harmonics

The presence of harmonics in electrical systems means that current and voltage are distorted and deviate from sinusoidal waveforms. Harmonic currents are currents circulating in the networks and whose frequency is an integer multiple of the supply frequency. Harmonic currents are caused by non-linear loads connected to the distribution system. A load is said to be non-linear when the current it draws does not have the same waveform as the supply voltage. The flow of harmonic currents through system impedances in turn creates voltage harmonics, which distort the supply voltage.

The most common non-linear loads generating harmonic currents use power electronics, such as variable speed drives, rectifiers, inverters, etc. Loads such as saturable reactors, welding equipment, and arc furnaces also generate harmonics. Other loads such as inductors, resistors and capacitors are linear loads and do not generate harmonics.

Effects of harmonics

Capacitors are particularly sensitive to harmonic currents since their impedance decreases proportionally to the order of the existing harmonics. This can result in capacitor overload, constantly shortening its operating life. In some extreme situations, resonance can occur, resulting in an amplification of harmonic currents and a very high voltage distortion.

To ensure good and proper operation of the electrical installation, the harmonic level must be taken into account in selecting power factor correction equipment. A significant parameter is the cumulated power of the non-linear loads generating harmonic currents.

Taking account of harmonics

The percentage of non-linear loads N_{LL} is a first indicator for the magnitude of harmonics. The proposed selection of capacitors depending on the value of N_{LL} is given in the diagram below.

A more detailed estimation of the magnitude of harmonics can be made with measurements. Significant indicators are current harmonic distortion THDi and voltage harmonic distortion THDu, measured at the transformer secondary, with no capacitors connected. According to the measured distortion, different technologies of capacitors shall be selected:

The capacitor technology has to be selected according to the most restrictive measurement. Example, a measurement is giving the following results :

- THDi = 15 % Harmonic solution.
- THDu = 3.5 % HDuty / Energy solution.

Harmonic solution has to be selected.

Safety features

Figure 1 - (a) Metal layer - (b) Polypropylene film.

Figure 2

Figure 3

Cross-section view of a three-phase capacitor after Pressure Sensitive Device operated: bended lid and disconnected wires.

Self-healing is a process by which the capacitor restores itself in the event of a fault in the dielectric which can happen during high overloads, voltage transients etc.

When insulation breaks down, a short duration arc is formed (**figure 1**).

The intense heat generated by this arc causes the metallization in the vicinity of the arc to vaporise (**figure 2**).

Simultaneously it re-insulates the electrodes and maintains the operation and integrity of the capacitor (**figure 3**).

Pressure Sensitive Disconnecter (also called 'tear-off fuse'); this is provided in each phase of the capacitor and enables safe disconnection and electrical isolation at the end of the life of the capacitor.

Malfunction will cause rising pressure inside the can. Pressure can only lead to vertical expansion by bending lid outwards. Connecting wires break at intended spots. Capacitor is disconnected irreversibly.

Active current (I_a):	In the vector representation, component of the current vector which is co-linear with the voltage vector.
Active power:	Real power transmitted to loads such as motors, lamps, heaters, computers, and transformed into mechanical power, heat or light.
Apparent power:	In a circuit where the applied r.m.s. voltage is V_{rms} and the circulating r.m.s. current is I_{rms} , the apparent power S (kVA) is the product: $V_{rms} \times I_{rms}$. The apparent power is the basis for electrical equipment rating.
Detuned reactor:	Reactor associated to a capacitor for Power Factor Correction in systems with significant non-linear loads, generating harmonics. Capacitor and reactor are configured in a series resonant circuit, tuned so that the series resonant frequency is below the lowest harmonic frequency present in the system.
Displacement Power Factor:	For sinusoidal voltage and current with a phase angle φ , the Power Factor is equal to $\cos\varphi$, called Displacement Power Factor (DPF)
Harmonic distortion:	Indicator of the current or voltage distortion, compared to a sinusoidal waveform.
Harmonics:	The presence of harmonics in electrical systems means that current and voltage are distorted and deviate from sinusoidal waveforms. Harmonic currents and voltages are signals circulating in the networks and which frequency is an integer multiple of the supply frequency.
IEC 60831-1:	"Shunt power capacitors of the self-healing type for a.c. systems having a rated voltage up to and including 1 000 V – Part 1: General – Performance, testing and rating – Safety requirements – Guide for installation and operation".
In-rush current:	High-intensity current circulating in one piece of equipment after connection to the supply network.
kVA demand:	Maximum apparent power to be delivered by the Utility, which determines the rating of the supply network and the tariff of subscription.
Polypropylene:	Plastic dielectric material used for the construction of low-voltage capacitors.
Power Factor:	The power factor λ is the ratio of the active power P (kW) to the apparent power S (kVA) for a given circuit. $\lambda = P \text{ (kW)} / S \text{ (kVA)}$.
Power Factor Correction:	Improvement of the Power Factor, by compensation of reactive energy or harmonic mitigation (reduction of the apparent power S , for a given active power P).

Rated current:	Current absorbed by one piece of equipment when supplied at the rated voltage.
Rated voltage:	Operating voltage for which a piece of equipment has been designed, and which can be applied continuously.
Reactive current (Ir):	Component of the current vector which is in quadrature with the voltage vector.
Reactive power:	Product of the reactive current times the voltage.
Service voltage:	Value of the supply network voltage, declared by the Utility
Service current:	Amplitude of the steady-state current absorbed by one piece of equipment, when supplied by the Service Voltage.
Usual formulas:	Apparent power: $S = V_{rms} \times I_{rms}$ (kVA). Active power: $P = V_{rms} \times I_a = V_{rms} \times I_{rms} \times \cos\varphi$ (kW). Reactive power: $Q = V_{rms} \times I_r = V_{rms} \times I_{rms} \times \sin\varphi$ (kvar).
Voltage sag:	Temporary reduction of the supply voltage magnitude, between 90 and 1 % of the service voltage, with a duration between ½ period and 1 minute.
